## 1 Data Preperation

```
[1]: import numpy
from ucimlrepo import fetch_ucirepo

# fetch datasets
breast_cancer_wisconsin_diagnostic = fetch_ucirepo(id=17)
bike_sharing = fetch_ucirepo(id=275)

### For Classification
features = breast_cancer_wisconsin_diagnostic.data.features.values
targets = breast_cancer_wisconsin_diagnostic.data.targets.values

classification_dict = {}

# M is 1 and B is 0
for i in range(len(features)):
    classification_dict[f"data[{i}]"] = {
        "features": features[i],
        "target": 1 if targets[i] == "M" else 0
    }

### For Regression
import pandas as pd

features = bike_sharing.data.features.copy()

# convert dteday to datetime
features["dteday"] = pd.to_datetime(features["dteday"])
features["dteday_new"] = (features["dteday"] - features["dteday"].min()).dt.days
features["dteday"] = features["dteday_new"]
features.drop(columns=["dteday_new"], inplace=True)

features = features.values
targets = bike_sharing.data.targets.values
```

```

regression_dict = {}

for i in range(len(features)):
    regression_dict[f"data[{i}]"] = {
        "features": features[i],
        "target": targets[i]
    }

```

## 2 Utils

```

[2]: import matplotlib.pyplot as plt
import seaborn as sns
import numpy as np

return confusion_matrices, avg_accuracy, elapsed_time

```

## Results:

```

[4]: confusion_matrices, avg_accuracy, elapsed_time =
↳k_fold_cross_validation_knn_classification()

plot_confusion_matrices(confusion_matrices)
print(f"Average Accuracy (k-fold cross-validation): {avg_accuracy:.4f}")
print(f"Total Runtime: {elapsed_time:.4f} seconds")

```

Average Accuracy (k-fold cross-validation): 0.9344

Total Runtime: 2.5409 seconds

**Comments:** Generated confusion matrices for each fold to analyze classification performance. The classifier achieved an average accuracy of 93.44%, indicating reliable performance across different data splits. The total runtime was approximately 2.54 seconds, which is longer than Decision Tree (DT) classification but shorter than SVM classification. This highlights a balanced trade-off between computational efficiency and classification accuracy, making the KNN classifier a practical choice for this dataset. And it is very easy to implement.

    elapsed_time = end_time - start_time

    avg_MSE = numpy.mean(MSEs)

    return avg_MSE, elapsed_time

```

### Results:

```

[12]: import random

random.seed(random_state)

# Select 5000 random keys from regression_dict
random_keys = random.sample(list(regression_dict.keys()), 5000)

# Create rand_reg_dict with only 500 random samples
rand_reg_dict = {key: regression_dict[key] for key in random_keys}

# Perform K-Fold Cross Validation on rand_reg_dict
avg_MSE_5000, elapsed_time_5000 = k_fold_cross_validation_knn_regression(
    rand_reg_dict
)

# Print Results
print(f"Average MSE ({k_folds}-fold cross-validation on 5000 random samples):_↵
↪ {avg_MSE_5000:.4f}")
print(f"Total Runtime: {elapsed_time_5000:.4f} seconds")

avg_MSE_all, elapsed_time_all = k_fold_cross_validation_knn_regression()

print(f"Average MSE ({k_folds}-fold cross-validation on all dataset):_↵
↪ {avg_MSE_all:.4f}")
print(f"Total Runtime: {elapsed_time_all:.4f} seconds")

```

```

Average MSE (6-fold cross-validation on 5000 random samples): 14428.0347
Total Runtime: 103.3699 seconds
Average MSE (6-fold cross-validation on all dataset): 7256.6588
Total Runtime: 1290.7022 seconds

```

**Comments:** In this part, we implemented a KNN regressor using the Manhattan distance to estimate the target values. Due to the time-consuming nature of the algorithm, we initially tested

the model on a sample of 5000 random data points instead of using the entire dataset. This decision was made to reduce computational load and speed up the testing process.

The average Mean Squared Error (MSE) obtained from the 6-fold cross-validation on the sample was 14428.0347, with a total runtime of 103.37 seconds. Subsequently, the model was evaluated on the entire dataset, resulting in an average MSE of 7256.6588 with a significantly higher runtime of 1290.70 seconds.

The runtime of the KNN regressor is particularly high compared to the Decision Tree (DT) regressor, which completes the task in just milliseconds. This highlights the computational inefficiency of KNN regression when dealing with large datasets, as it requires calculating distances between each test point and all training points. Additionally, KNN requires storing the entire training dataset in memory, which further contributes to its computational and memory inefficiency. Despite achieving reasonable accuracy, this trade-off between accuracy, memory usage, and computation time is a critical consideration when selecting the regression technique.

    plt.show()

```

## Results:

```

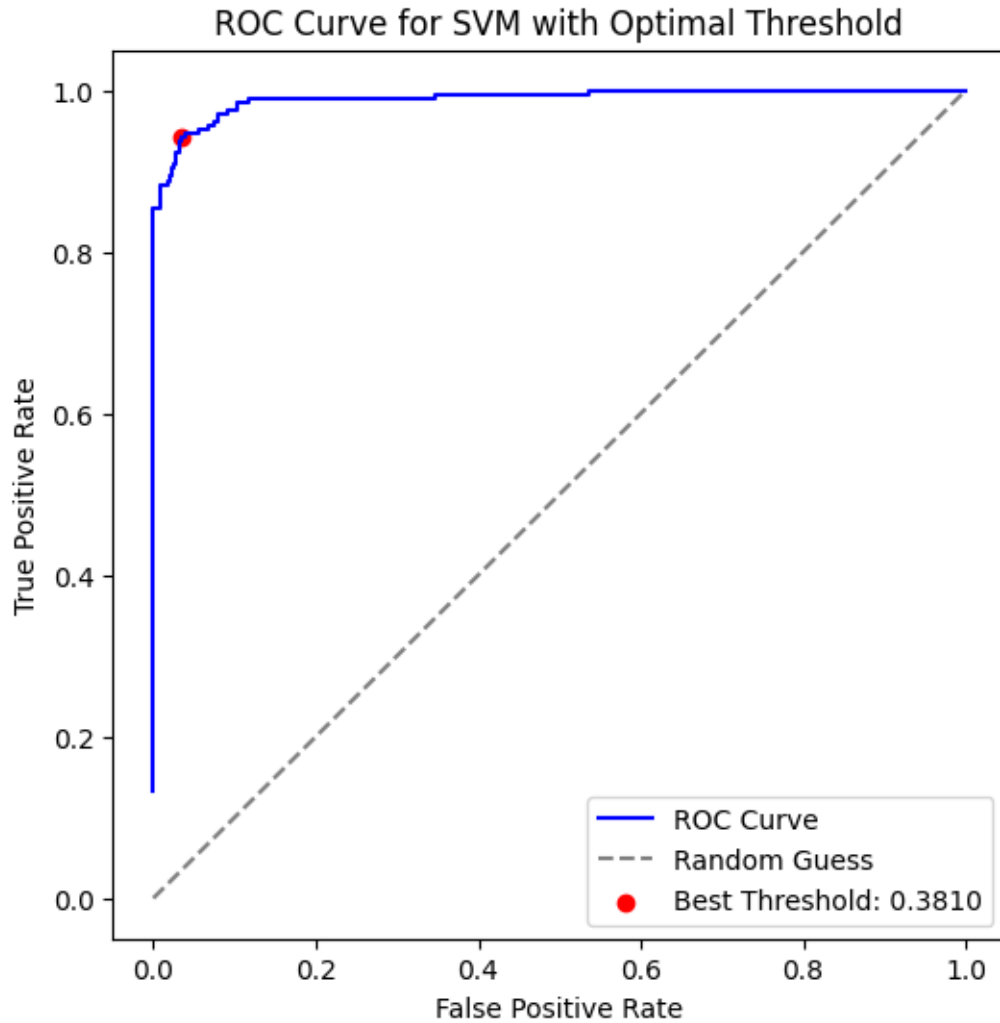

[6]: confusion_matrices, avg_accuracy, elapsed_time =
    ↪k_fold_cross_validation_svm_classification()

plot_confusion_matrices(confusion_matrices)

print(f"Average Accuracy (k-fold cross-validation): {avg_accuracy:.4f}")
print(f"Total Runtime: {elapsed_time:.4f} seconds")

```

Optimal Threshold (Fawcett's Method): 0.3810

Optimal Accuracy (using best threshold): 0.9574

Average Accuracy (k-fold cross-validation): 0.9521

Total Runtime: 22.5709 seconds

**Comments:** The model was designed to calculate the optimal decision threshold using Fawcett's method (Youden's J statistic)(TPR - FPR) and visualize the results through ROC curves and confusion matrices.

The average accuracy obtained from the k-fold cross-validation was 95.21%, which is the highest accuracy among the classifiers tested. Additionally, applying the optimal threshold improved the accuracy to 95.74%, demonstrating the effectiveness of adjusting the decision boundary.

Despite the high accuracy, the SVM classification took approximately 22.57 seconds to complete, making it significantly slower than both the KNN and DT classifiers. This indicates that while SVM provides superior classification performance, it comes at the cost of increased computational time.

## 6 Part: 4

Code:

```
[13]: # K Fold Cross Validation using Mean Square Error for SVM Regression

import time, random
from sklearn.svm import SVR
import numpy

def k_fold_cross_validation_svm_regression(data: {}=regression_dict, k_fold:

print(f"Average MSE ({k_folds}-fold cross-validation on all dataset):_
↪{avg_MSE_all:.4f}")
print(f"Total Runtime: {elapsed_time_all:.4f} seconds")

```

Average MSE (6-fold cross-validation on 5000 random samples): 22333.5858  
 Total Runtime: 33.6885 seconds  
 Average MSE (6-fold cross-validation on all dataset): 22041.1762  
 Total Runtime: 386.5354 seconds

**Comments:** The model predicted the target values by minimizing the Mean Squared Error (MSE).

The average MSE obtained from the 6-fold cross-validation on a random sample of 5000 data points was 22333.5858, with a total runtime of 33.69 seconds. On the entire dataset, the model achieved an average MSE of 22041.1762, taking 386.54 seconds.

Although the runtime is still significantly higher than Decision Trees (DT), it is much lower than KNN regression. This improvement is mainly due to SVM not requiring the entire dataset to be stored and traced during each prediction, unlike KNN. This makes SVM a more efficient choice for large datasets. But it is not maintaining an acceptable accuracy.

```

**Comments:** The Decision Tree classifier proved to be tremendously fast compared to both KNN and SVM classifiers, completing the classification task in milliseconds. This speed advantage makes DT a highly efficient algorithm, especially for large datasets.

Despite the reduced complexity of pruned trees, the accuracy remained comparable to that of the unpruned tree. This indicates that pruning effectively reduces overfitting without significantly sacrificing performance. Among the three strategies, the max\_depth-based pruning(early stopping) demonstrated the best balance between accuracy and efficiency, providing reliable performance with minimal runtime.

Overall, the Decision Tree algorithm showcased computational efficiency while maintaining accuracy, making it a choice for real-time and large-scale applications.

## 8 Part 6:

Code:

```
[9]: # K Fold Cross Validation using Mean Square Error
